Claim 3; Fig 6; 69pp; English.

New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated with tumours or mRNA expressed from gene encoding

multiple drug resistance

sequences given in AAQ51825-2266 represent areas of mRNAs which are associated with development or maintenance of chronic myelogenous leukemia (CML), promyelocytic leukemia, Burkitt's lymphoma, or acute lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer. The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a hammerhead motif, but may also be formed in the motif of a hairpin, hepatitis delta virus, group I introm or RNasep-like RNA. These ribozymes and be used to inhibit other animals by modulating expression of the corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic and transformed cells elicits inhibition of the transformed state. Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the mechanism of drug resistance used by transformed cells and thus enhances drug therapies for tumnours. The ribozymes may also be used to study the development or expression of a transformed phenotype in man and genetic drift and mutations within cells.

Sequence 36 BP; 10 A; 13 C; 8 G; 5 U; 0 other;

The sequences given in AAQ51825-2266 represent areas of mRNAs which are associated with development or maintenance of chronic myelogenous leukemia (CML), promyelocytic leukemia, Burkitt's lymphoma, or acute lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer. The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a hammerhead motif, but may

New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated with tumours or mRNA expressed from gene encoding

The primers AAV28335 and AAV28336 were used to amplify the rat bcl-y gene. The mammalian bcl-y genes encode a protein that is a member of the bcl-1 family, components in the cell death pathway. The bcl-2 family have both apoptotic activity and the apoptosis blocking activity. bcl-y falls in the apoptosis activity category. The recombinant protein may administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell death is desired.
also be formed in the motif of a hairpin, hepatitis delta virus, group I intron or NaseP-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and other animals by modulating expression of the corresponding gene.
                                                                Cleavage of target mRNAs expressed in pre-neoplastic and transformed cells elicits inhibition of the transformed state. Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the mechanism of drug resistance used by transformed cells and thus enhances drug therapies for tumours. The ribozymes may also be used to study

The specification also describes human bcl-y protein (Hbcl-y). Rbcl-y and Hbcl-y are homologues of the bcl-2 protein thought to be involved in programmed cell death (apoptosis and necrosis). Rbcl-y and Hbcl-y proteins may be used to treat conditions associated with a disruption of the cell death pathway. If they act as cell death almohibitors, they may be used in therapies to treat subjects suffering from: strokes, head trauma, Alzheinmer's Disease, neural and muscular degenerative diseases (especially multiple sclerosis), myocardial infarction, vitally induced cell death, aging, spinal cord injuries and amyotrophic lateral sclerosis- conditions where cells under go premature cell death as a result of triggers which may or may not be apparent. They may also be used in this way to develop cell lines which remain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            - useful
                                                                                                                                                                                                                                                                                                                                                                                                                   PCR primer used to amplify cDNA encoding the rat bcl-y protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the rat and human bcl-2 protein cell death

viable in culture for an extended period. In contrast, if they act as eachl death stimulators, Rbcl-y and Hbcl-y may be used to treat conditions associated with prolonged cell life span such as cancer (especially kaposi's sarcoma and lung cancer) and auto/hyperimmune diseases. They may also be used to cause cell death in, and hence control, parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human proteolytic enzyme regulatory protein 12 with cytostatic, virucidal, immunomodulatory, antiinflammatory and mamostatic activity. The polypeptide and encoded polynucleotide are applicable in diagnosis and treatment of malignant tumnour, haemopathy, HIV infection, immunological diseases and various inflammations. The present sequence is that of a human proteolytic enzyme regulatory protein 12 PCR primer, useful to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; proteolytic enzyme regulatory protein 12; cytostatic; virucidal; immunomodulatory; antiinflammatory; haemostatic; malignant tumour; HIV; infection; human immunodeficiency virus; immunological disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human proteolytic enzyme regulatory protein 12 and encoded bolynucleotide, applicable in diagnosis and treatment of cancer, haemopathy, human immunodeficiency virus infection, immunological diseases and inflammation

Human; Bcl-2; gene therapy; apoptosis inhibitor; mutant; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an apoptosis inhibitor comprising the amino acid sequence of Bcl-2 protein in which at least one serine residue is substituted by alanine or aspartic acid. The protein has increased apoptosis inhibitory activity compared with the wild type Bcl-2 protein. The mutated Bcl-2 protein is useful in the treatment of disorders caused by apoptosis. The present sequence was used to amplify DNA encoding the human Bcl-2 protein.

                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for estimating transcription levels of genes encoding interferons, interferon-dependent and proliferative cytokines. The method involves determining cytokine mRNA levels, using a combination of RT-PCR with blot- and dot-hybridisation. To illustrate the method, cytokines (alpha-1, beta-1 and gamma-1 interferon), interferon-regulated enzymes (2',5'-oligoadenylatesynthetase, RNABase L and ds-protein kinase) and factors of cellular proliferation (Bcl-2, Ras antigen and gamma-actin cytokeleton protein) were used. The present oligonucleotide was used to

interferon), interferon-regulated enzymes (2',5'-oligoadenylatesynthetase, RNAse L and ds-protein kinase) and factors of cellular proliferation (Bcl-2, Fas antigen and gamma-actin cytoskeleton protein) were used. The present oligonucleotide was used to
                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for estimating transcription levels of genes encoding interferons, interferon-dependent and proliferative cytokines. The method involves determining cytokine mRNA levels, using a combination of RT-PCR with blot- and dot-hybridisation. To illustrate the method, cytokines (alpha-1, beta-1 and gamma-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Anticode oligomer; antisense oligonucleotide; bcl-2; cancer; therapy; leukemia; lymphoma; solid tumor; breast cancer; autoimmune disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is a human bcl-2 oligonucleotide based on which an antisense oligonucleotide complementary to the splice donor site of the human bcl-2 mRNA can be constructed. Bcl-2 antisense oligonucleotides straddle strategic sites such as the translation initiation site, donor and acceptor splicing sites, or sites for transportation or degradation.
                                                                                                                                                   The antisense oligonucleotide SD-AS (AAQ86645) is complementary to a portion of the splice donor site of the pre-mRNA coding strand of the human bcl-2 gene. It reduces the expression of bcl-2 gene product, thereby inducing programmed cell death of certain cancer cells. The corresp, bcl-2 sense splice donor site region was synthesized for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     - useful

Blocking translation at such strategic sites prevents the formation of functional bc1-2 gene product. These oligonucleotides may be used for treating cancers associated with high levels of bc1-2 gene expression, especially lymphomas and some leukaemias.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating or preventing cancer, tumors and carcinomas, comprises administering B cell lymphoma/leukemia-2 antisense oligonucleotide at high doses for short period for time with one or more cancer

The present invention is directed to the use of bcl-2 antisense oligoners, particularly (33139 (see ABL54148), to treat and prevent bcl-2 related disorders. Administration at high doses results in significant therapeutic responses, including low toxicity, high tolerance and prolonged survival. Administration at high doses for short periods of time (less than 14 days) also provides significant therapeutic responses in the treatment of cancer. The bcl-2 antisense oligomer may also

The sequences given in AAQ51825-2266 represent areas of mRNAs which are associated with development or maintenance of chronic myelogenous leukemia (CML), promyelocytic leukemia, Burkitt's lymphona, or acute lymphocytic leukemia, follicular lymphona, B-cell acute lymphocytic leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer. The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a hammerhead motif, but may also be formed in the motif of a hairpin, hepatitis delta virus, group in intro or RNasep-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and other animals by modulating expression of the corresponding gene. Cleavage of target mRNAs expression of the corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic and transformed cells elicits inhibition of the transformed state. Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the mechanism of therapies for tumours. The ribozymes remove the mechanism of the rapies for tumours. The ribozymes and also be used to study genetic drift and mutations within cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cardiovascular disease; differential expression; target gene; pathway gene; fingerprint gene; atherosclerosis; ischaemia; reperfusion; hypertension; restenosis; arterial inflammation; vector; antibody; diagnosis; gene therapy; drug screening; bcl-2; polymerase chain reaction; PCR; primer; ss.
                                    New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated with tumours or mRNA expressed from gene encoding

Fingerprinting gene; rchd502; transmembrane protein; cardiovascular; fingerprint/target gene; up.regulated; endothelial cell; shear-stress; atherosclerosis; ischemia; reperfusion; hypertension; restenosis; human; RT-PCR; primer; bcl-2; mouse; ss.
                                                                                                                                                       Monocyte RNA from apolipoprotein E (apoE)-deficient and control mice was compared using primers for mouse bc1-2 (AAT36053 and AAT36054) and gamma-actin (AAT36055 and AAT36056). bc1-2 mRNA levels were significantly lower in the apoE-deficient mice (an animal model of atherosclerosis). Regulation of the mouse bc1-2 gene appeared to be regulated by serum cholesterol levels. Similar results were obtd. with the human bc1-2 and glutathione peroxidase genes (see also AAT36057-58). The discovery that certain genes (see also AAT36029-36) are differentially expressed in cardiovascular diseases can be used to develop methods for the diagnosis and treatment of such diseases.
                                                                      New genes differentially expressed in cardiovascular disease - and related vectors, host cells, proteins and antibodies, for diagnosis, monitoring, treatment and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Reverse primer for RT-PCR analysis of mouse bcl-2 mRNA.

The invention relates to a rchd502 target/fingerprint gene encoding a transmembrane protein. The invention provides cDNAs contained in plasmids prCHD5025F (ATCC 69982) that encode the rchd502 polypeptide, and are differentially expressed in cardiovascular disease states. Cultured genetically engineered host cell containing the rchd502 polypeptides in operative association with a nucleotide regulatory element are used for producing a polypeptide rchd502 gene product. Identifying that the fingerprint/rarget gene rchd502 is differentially expressed (up-regulated) by endothelial cells subjected to shear stress, provides a tool for the diagnosis and treatment of cardiovascular disease e.g. atherosclerosis, ischemia/reperfusion, hypertension, restenosis. The fingerprint gene is useful for testing the efficacy of candidate drugs in basic research and in clinical trials and or imaging of a diseased cardiovascular tissue. The gene may also be used in screening for ligand-receptor interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; cardiovascular disease; atherosclerosis; ischaemia; restenosis; reperfusion; hypertension; arterial inflammation; diagnosis; rchd528;
New polynucleotides consisting of residues 1-1929 of the rchd502 gene - are differentially expressed in cardiovascular disease states, and can therefore be used to treat and diagnose cardiovascular diseases
                                                                                                                                                                                                                                                                                                                                                                                                                               4,0000

The present invention describes rchd528 protein. A method has been developed for producing the rchd528 gene product. The present invention also describes methods and compositions for the treatment and diagnosis of cardiovascular diseases, including: atherosclerosis; ischaemia; restenosis; reperfusion; hypertension; and arterial inflammation. The present sequence represents a primer used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated rchd502 polypeptides, differentially expressed in response to endothelial cell shear stress, used for diagnosis, monitoring clinical trails, and treating cardiovascular diseases such

It was used with the forward primer given in AAA88586 in a quantitative RT-PCR analysis of mouse bcl-2 mRNA levels in app.8-deficient mice, a murine model of atheroscierosis. bcl-2

This sequence represents a PCR primer used to amplify the mouse bcl2 nucleotide sequence. The primer is used in methods for the flachtification of the marker proteins and differentially expressed genes of the invention. The invention relates to the rchd523 transmembrane polypeptide (see AAY78506) encoded by cDNA contained in the plasmid pfchd523. The rchd523 protein is differentially expressed in diseased cells compared to healthy cells. The rchd523 protein may be used as a marker protein for the diagnosis of cardiovascular diseases including atherosclerosis, ischaemia, reperfusion, hypertension, restenosis and arterial inflammation. Trchd523 peptides may be used as antigens in the production of antibodies specific for rchd523. The anti-rchd523 antibodies may then be used in diagnostic assays to quantitate rchd523
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Differentially expressed; cardiovascular disease; atherosclerosis; ischaemia; reperfusion; hypertension; restenosis; arterial inflammation; bcl2; differential display analysis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Marker proteins for the diagnosis of cardiovascular diseases such as atherosclerosis and hypertension, comprising peptide sequences derived from the rchd523 transmembrane protein -
mRNAs were shown to be lower in apoE-deficient mice relative to wild type controls. The invention provides novel human genes (see AAAA86576-83) that are differentially expressed in cardiovascular disease states, and which are of diagnostic and therapeutic use.
                                                                                                                                    4,0000

The present invention describes an isolated polypeptide (I) comprising either the amino acid sequence of 1481 residues, given in AAK6847, or an amino acid sequence encoded by the cDNA contained in plasmids prCHD528A (ATCC 69985), prCHD528B (ATCC 69986) and prCHD528C (ATCC 69987). The polypeptide is useful in the treatment and diagnosis of cardiovascular disease, such as, atherosclerosis, ischaemia/reperfusion, hypertension, restenosis and arterial inflammation. AAZ88001 to AAS88040, and AAX68444 to AAX68457 represent sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated polypeptide for treating and diagnosing cardiovascular disease, such as, atherosclerosis, ischemia/reperfusion, hypertension, restenosis and arterial inflammation -

The present invention describes methods for inhibiting the growth of (1), inducing apoptosis in (II), inhibiting tumourigenesis in (III), inhibiting neoplastic transformation in (IV) cancer cells and for enhancing the effectiveness of chemo-(IV) and radiotherapies (VI) for the treatment of cancer. The methods comprise administering an antagonist of STAT (signal transducer and activator of transcription) signalling. The methods may be used for inhibiting the growth of cancer cells (II), inhibiting tumourigenesis in cancer cells (II), inhibiting tumourigenesis in cancer cells (III), inhibiting neoplastic transformation in cancer cells (IV) and for enhancing the effectiveness of chemo-(IV) and radiotherapies (VI) for the treatment of cancer. The present sequence represents a specific gene amplification PCR primer for boll-2, which is used in an example from the present invention.

                                                                                      Human; Bcl-2; gene therapy; apoptosis inhibitor; mutant; primer; ss.
                                                                                                                                                                                                                                                                                The invention relates to an apoptosis inhibitor comprising the amino acid sequence of Bc1-2 protein in which at least one serine residue is substituted by alanine or aspartic acid. The protein has increased apoptosis inhibitory activity compared with the wild type Bc1-2 protein. The mutated Bc1-2 protein is useful in the treatment of disorders caused by apoptosis. The present sequence was used to create a mutant Bc1-2 protein of the invention.
                                                                                                                                                                                                                                          New apoptosis inhibitors, useful for treating apoptosis related

The present invention relates to a method for the clinical validation of a target from disseminated cancer cells, characterised in that for a population of individuals it is determined whether a status of the target determined in disseminated cancer cells of the individuals correlates with at least one cancer-related information about the clinical status of the individuals. The method is useful for clinically validating target from disseminated cancer cells. The present sequence is a probe used

Producing sub-population of labeled nucleic acids, useful for analysing differences in RNA profiles between several different physiological sources, using set of distinct gene specific primers

Example 3; SEQ ID No 596; 11pp; English.

The invention relates to producting a sub-population of labeled nucleic acids (NAs) comprising contacting a NA sample from a physiological source, with a pool of 50 distinct gene specific primers under suitable conditions to enzymatically generate sub-population of NAS, where conditions to enzymatically generated using a single gene specific primer has a sequence complementary to a distinct mRNA, and each labeled NA is generated using a single gene specific primer. The method is useful for producing a sub-population of labeled NAS which is useful for analysing the differences in the RNA profiles comprises producing subpopulation of labeled NAS for the different physiological sources, where the method is preferred by preferred by hybridising the labeled NAS for each of the source to identify differences in the population, where the comparison is preferably performed by hybridising the labeled NAS for each of the sources to an array of probe NAS stably conditions. The sources of a substrate to produce a hybridisation. The sources where differential expression assays are the sources, where differential expression assays are the sources, where differential gene expression assays are tissue e.g. neoplastic a normal tissue, or different tissue or subtissue types. The present sequence is a human gene specific PCR primer used in the method of the invention.

Note: The sequence data for this patent did not form part cof the printed specification, but was obtained in electronic cof the printed specification, but was obtained in electronic cof the printed specification, but was obtained in electronic cof the printed specification, but was obtained in electronic cof the printed specification. http.wipo.seqdata.uspto.gov/sequence.html?DocID=6352829B1.

New apoptosis inhibitors, useful for treating apoptosis related disorders

Example 1; Page 10; 43pp; Japanese.

The invention relates to an apoptosis inhibitor comprising the amino acid sequence of Bcl-2 protein in which at least one serine residue is substituted by alanine or aspartic acid. The protein has increased apoptosis inhibitory activity compared with the wild type Bcl-2 protein. The mutated Bcl-2 protein is useful in the treatment of disorders caused by apoptosis. The present sequence was used to create a mutant Bcl-2 protein of the invention.

Chittenden TD, Lutz RJ;

WPI; 1996-518805/51. P-PSDB; AAW06293 Peptide(s) comprising GD domains - have similar activities to wild type Bak, and cause cellular apoptosis for treatment of viral infection

Claim 6; Page 45; 69pp; English.

The term GD domain refers to a protein domain first identified in and shown to be essential for the interaction of Bak with Bcl-x(L) and for Bak's call killing function; and to peptides and/or molecules capable of mimicking its structure and/or function. The present sequence encodes a GD domain corresponding to amino acid residues 82-94 of Bak.

An antibody raised against a GD domain may be used to screen a cDNA cepression library for clones comprising cDNA inserts encoding immunocrossreactive proteins. Truncated GD domain peptides have been shown to maintain the protein binding and cell killing function cannour cell. These peptides act independently of p53 status. Bak or GD domain mimetics that inhibit Bcl.2 may be selectively toxic to certain tumours, e.g. follicular lymphoma, which depend on high levels of Bcl.2 for their continued growth and survival. GD domain mimetics

may also be used for combatting viral infections by causing apoptosis

which are capable of modulating apoptosis. The GD domains are essential for Bak's interaction with Bcl-XL, and to Bak's cell killing function. The GD domains mediate key protein/protein interactions with multiple cell death regulatory molecules. Also described are methods of identifying agonists or antagonists of GD domains. The methods are useful for identifying agents capable of modulating GD domain mediated heterodimerisation or homodimerisation. The methods are particularly useful in drug screening and design, e.g. for identifying agents for treating autoimmune disease or cancer, or for identifying modulators of apoptosis. The present DNA sequence encodes a GD domain region. present invention relates to novel peptides, designated GD domains, The

                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an apoptosis inhibitor comprising the amino acid sequence of Bcl-2 protein in which at least one scrine residue is substituted by alamine or aspartic acid. The protein has increased apoptosis inhibitory activity compared with the wild type Bcl-2 protein. The mutated Bcl-2 protein is useful in the treatment of disorders caused by apoptosis. The present sequence was used to create a mutant Bcl-2 protein of the invention.

The protein has increased apoptosis inhibitory activity compared with the wild type Bcl-2 protein. The mutated Bcl-2 protein is useful in the treatment of disorders caused by apoptosis. The present sequence was used to create a mutant Bcl-2 protein of the invention.

AAT96580 and AAT96579 are PCR primers used to amplify a novel gene, bcl-w, a member of the mouse bcl-2 gene family. This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, Upregulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of thybridomas and to increase survival of primary explants during genetic modification. It can be used to produce recombinant Bcl-w for therapy, diagnosis, antibody production or screening of potential modulators.
                                                                                                                                                                                                                                                                                                                                                                                            to induce
                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid encoding apoptosis related gene bcl-w - used or inhibit cell survival, e.g. for treatment of cancer and

                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a PCR mutagenesis primer used to mutagenise the marA coding sequence derived from transposon Tn21, to adapt it for plant expressibility. The nucleic acid molecule produced is useful for producing transgenic plants that are resistant to toxic heavy metals (especially mercury) and so can be used remediate and/or revegetate contaminated areas. The bacterial merA gene is derived from the transposon Tn21, which was originally isolated from the Incompatibility Group IncFII resistance plasmid NR1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Organometal; resistance; transcription; translation; regulation; merA;

The invention relates to a nucleic acid molecule comprising a coding sequence for an organometal resistance protein, which is operably linked downstream of and under the regulatory control of a plant-expressible transcription and translation regulatory sequence. The organometal resistance gene is especially the merA gene from the transposon Th21 or the E.coli merB gene. merA encodes a mercuric ion reductase and merB encodes a corganomercury lyase. The nucleic acid sequences are useful for producing transgenic plants which are capable of efficiently processing mercury. These plants are able to remove or detoxify metal compounds such as methyl mercury and ionic mercury from soil, sediment, and aquatic environments providing an efficient bioremediation of metal and organometal contaminated sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a PCR primer used to amplify the Tn21 merA gene which is mutated by random mutagenesis (see AAZ28584-Z28589 for mutated sequences) and the mutated sequences are expressed in the

Use of triplex-forming oligo-nucleotide - to inhibit proliferation of cells contg. an erb. B2/neu gene site, for treating cancers, psoriasis etc.

Disclosure; Page 10; 26pp; English.

The sequences given in AAQ41911-13 are control isomers which comprise randomised sequences, based on triplex-forming isomers (TFO), which do not bind to the erb B2/neu target sequence, and have no effect on orb bayneu expression. The erb B2/neu (HER-2) gene is the human homologue of the rat neu gene. This human homologue is frequently amplified in tumours. When expressed at high levels in NHB73 cells, erb B2/neu is strongly transforming and results in a high incidence of mammary tumours in transgenic mice. The core promoter element of the B2/neu resides within a 300 bp region of the 5' flanking domain. This region contains elements which confer sensitivity to enhance core. The E2/neu resides within a 300 bp region of the 5' flanking domain. The promoter function in the presence of cell growth factors such as TPA, core and retinoic acid. Therefore, overexpression of of the B2/neu may be one mechanism leading to cancer initiation or expression. The sequences given in AAQ41905-10 are TFOS which are specific to the promoter region of erb B2/neu. They bind to the major groove of the complex to form a triplex. The TFOS are complementary location in the DNA duplex is a GC pair and T when the complementary location in the DNA duplex is an AT base pair. The target sequence such they include a G when the complementary location in the DNA duplex is an AT base pair. The target side for these TFOS should have a stretch of DNA which is at least 65% puring or these TFOS should have a stretch of DNA which is at least 65% puring or the CAT box and the TATA box. Inhibition at the CAT box and the TATA box. Inhibition of the erb protein with TFIId at the TATA box. Inhibition of the erb procession of the gene and may therefore be used to treat or prevent cancers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                             directed against the progesterone receptor gene and inhibits progesterone-dependent transcription. The region of the target protected from DNaseI digestion by the PREZAP TVO overlaps more than one half-site of each progesterone receptor element (PRE). Two other TFOs were designed as controls of PREZAP activity; PRESP (AAA4472) has the PREZAP sequence inverted in a strand of opposite polarity and "HIV CTR" (AAA44773) contained an unrelated sequence of G and T residues with similar length and G/T ratio. Unlike with PREZAP, no triplexes were formed with either HIV CTR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            therapy; infection; herpes simplex virus; human papilloma virus;

The oligonucleotides (See AAQ79201-52) can be used to treat viral infections. The oligonucleotides inhibit viral replication by forming guanosine tetrads which form a stabilised 3D structure. Preferred oligonucleotides contain at least 2 runs of at least 2 guanosine bases and may be capped at the 3' terminus with a modifier selected from polyamine, poly-L-lysine, cholesterol and propanolamine. They may also have a modified phosphodiester linkage or be modified to contain a phosphorothioate linkage. They are used to treat infections with viruses such as herpes simplex virus, human papilloma virus, Epstein-Barr virus, HIV, adenovirus, respiratory syncitial virus, hepatitis B virus or human cytomegalovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human immunodeficiency virus; HIV; Epstein Barr virus; EBV; herpes simplex virus; HSV; human papilloma virus; HPV; adenovirus; respiratory syncytial virus; RSV; cytomegalovirus; CWV; hepatitis B; integrase inhibition; guanosine tetrad; ss.

                                                                                                                                                                                                                                                                                        AMT51619-T51698 are oligonucleotides used to inhibit the production of viruses within a host cell. The oligonucleotides may form guanosine tetrads (structures formed of eight hydrogen bonds by coordination of the four oxygen atoms of guanine with alkali cations believed to bind to the centre of a quadruplex, and by strong stacking interactions) and are used to prevent the integration of viral nucleic acid into a host genome. The oligonucleotides inhibit functioning of the integrase enzyme and hence prevent viral infection. Viral infections that may be treated include human immunodeficiency virus (HIV), Epstein Barr virus (EBV), herpes simplex virus (HSV), human papilloma virus (HPV), adenovirus, respiratory syncytial virus (RSV), cycomegalovirus (CMV) and hepatitis B virus (HBV), especially HIV-1 infection.
                                                                                                                                                                                              Oligo:nucleotide(s) capable of forming guanosine tetrads - inhibit viral enzyme responsible for integrating viral nucleic acid into the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide #4 forms an intramolecular stacked tetrad structure.

Sequences AAX79210-X79275 represent oligonucleotides (ON) which are able to form a columnar box or "stacked tetrad" structure by intramolecular internucleotide binding. The ONS are used to inhibit the replication of viruses. They are able to suppress virus production for prolonged periods after an initial short treatment regimen. They can be used for treating pathophysiological states caused by viruses such as herpes simplex virus, human papilloma virus, Epstein Barr Virus, Human average of the periods of the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cdn-1; apoptosis modulator; adoptive immunotherapy; therapy; HIV; autoimmune disease; reperfusion injury; hepatitis, osteoporosis; shock; lymphoma; eczema; primer; polymerase chain reaction; PCR;

New nucleic acid sequences encoding Cdn apoptosis modulators - and related vectors, transformed cells, proteins and antibodies, useful or diagnosis and treatment e.g. of HIV infection, reperfusion injury
                                                                                                                                                                                                                                                                                                                    In order to identify new Bcl-2 family members, degenerate PCR primers (AAQ95495-96) based on sequences in these regions were used in the amplification of human heart and B lymphoblastoid cell line WI-L2 cDNA. Cdn-1 cDNA (AAQ95492) was obtd.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; detection of early stage allergic disease; atopic dermatitis; antiallergic; eosinocyte; eosinophil; bcl-2; probe; ss.

The present invention relates to a method for detecting early stage allergic diseases, particularly atopic dermatitis. The method comprises determining the expression levels of granulocyte macrophage colony stimulating factor receptor alpha or beta (GM-CSF R-alpha or beta), interleukin 3 receptor alpha (IL-3 R-alpha), bcl-2, bcl-x, platelet activation factor receptor (PAF R) or CD44 in eosinocytes of a subject to be tested. The method further comprarison with expression levels in healthy volunteers. The method is useful for the early diagnosis and treatment of early stage allergic diseases such as atopic dermatitis. The present sequence represents a probe used in the methods of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytokine; tumour necrosis factor-alpha; TNF-alpha; lipopolysaccharide; mitogen-induced; colinear triplex; capping group; cholesterol; tumour cell; glioblastoma cell; ss.

human vWF positive sequences using two synthetic DNA probes (AAQ13426-7). The probes were synthesised according to the published DNA sequence (Sadler et al., Proc. Nat. Acad. Sci. 82: 6394-8 (1985) and Verweij et al., EMBO J. 3: 1829-47 (1986)) of human VWF.
                                                                                                                                                                     The invention relates to an apoptosis inhibitor comprising the amino acid sequence of Bc1-2 protein in which at least one serine residue is substituted by alanine or aspartic acid. The protein has increased apptosis inhibitory activity compared with the wild type Bc1-2 protein. The mutated Bc1-2 protein is useful in the treatment of disorders caused by apoptosis. The present sequence was used to create a mutant Bc1-2 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A human endothelial cDNA library in lambda gt11 was screened for
                                                                                   New apoptosis inhibitors, useful for treating apoptosis related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Non-glycosylated peptide(s) of vWF GPlb binding domain inhibits platelet adhesion and aggregation for treatment of cerebrovascular and cardiovascular disorders
                                                                                                                                                                                                                                                                                                                                                                                      27

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dp
AAT08787-T08792 represent oligonucleotides capable of inhibiting cytokine production. These sequences specifically inhibit tumnour necrosis factor-alpha (TNF-alpha) production. They also inhibit tumnour lipopolysaccharide or other mitogen-induced production of TNF-alpha. The sequences were designed to form a colinear triplex with a region of the TNF-alpha gene. The triplex is stabilised by the guanosine tetrads, or the runs of at least 2 contiguous quanosines. This sequence targets the region from 1429 to 1456 of the TNF-alpha gene (relative to the mRNA start site). All of the sequences have a 3' capping group (either an anne or a cholesterol) to confer stability against nuclease digestion. The sequences can be used to inhibit the growth of tumour cells, particularly TNF-alpha responsive tumour cells (preferrably glioblastoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; Bc1-2; gene therapy; apoptosis inhibitor; mutant; primer; ss

This synthetic oligonucleotide corresponds to nucleotides flanking the 3' end of the human von Willebrand Factor (vWF) GPIb binding domain coding region. It was used as a probe for the detection of vWF sequences in a human endothelial cell cDNA library. A GPIb binding domain 5' probe was also used (see AAV74158). A series of vWF cDNA clones covering the entire GPIb binding domain (see AAV74157) were identified and isolated. The invention provides non-glycosylated, biologically active polypeptides (see AAW90119-20) which comprise the vWF GPIb binding domain. These are used in claimed methods for treating and preventing cerebrovascular and cardiovascular disorders, and for

```
This sequence represents a probe for DNA encoding the protein of the invention. The protein of the invention is the GPlb binding domain of the invention. The protein of the invention is the GPlb binding domain of the von Willebrand factor. The protein is used for inhibiting platelet aggregation, especially for treating cerebrovascular disorders. It is also used for treating cardiovascular disorders, especially acute myocardial infarction or angina. The protein is also used for inhibiting platelet aggregation before, during or after angioplasty, thrombolytic treatment or coronary bypass surgery, for maintaining blood vessel or coronary before, during or after coronary bypass surgery. It can also be used for inhibiting thrombosis, optionally associated with an inflammatory response, for inhibiting platelet adhesion to damaged constrains or devices, for inhibiting re-occlusion after angioplasty or thrombolysis, or for thrombolytic treatment of thrombi-containing platelet-rich aggregates.
                                                                                                                                                                                                                                                                                                                                                                                                                          Von Willebrand factor; GP1b binding domain; inhibitor; re-occlusion; platelet aggregation; cerebrovascular disorder; cardiovascular disorder; angloplasty; thrombi-containing platelet-rich aggregate; thrombosis;

This is a probe for the human von Willebrand factor (VWF). The invention relates to methods of treating arteriosclerosis and stenosis using polypeptides derived from the human VWF GPIb binding domain. VWF is a large plasma protein which is synthesised in the endothelial cells of the blood vessels, and also by megakaryocytes which are the precursors of platelets. The treatment methods involve the administration of a polypeptide (see AAVG7242 or AAVG7243). These polypeptides contain a fragment of the VWF GPIb binding domain amino acid sequence. The polypeptides inhibit platelet adhesion and aggregation, therefore the methods may be used for preventing arteriosclerosis and stenosis (as a result of smooth muscie proliferation following vascular injury). The polypeptides may also be used for treating other cerebrovascular and
                                                                                                                                                                                                                                                                                                                                                                                         Von Willebrand Factor; vWF; GPIb binding domain; arteriosclerosis; platelet adhesion inhibitor; stenosis; cerebrovascular injury; human; thrombosis; cardiovascular injury; probe; ss.

    A. fumigatus codon optimised phytase gene constructing phy52r PCR primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a Pichia cell comprising at least one copy of heterologous nucleotide sequence encoding a polypeptide of interest, where the codon usage of the sequence has been adjusted to match the preferred codon usage of P. methanolica. The invention also relates to a method for producing high yields of heterologous codon optimised polypeptide in a Pichia cell. The Pichia cell is useful for producing a polypeptide of interest, where the polypeptide is encoded by a nucleotide sequence heterologous to P. methanolica. The present sequence is a PCR primer used for constructing Aspergillus fumigatus codon optimised phytase gene which is the heterologous DNA used in the
                                                                                                                                                                                                                                                                                                                Phytase; Pichia cell; heterologous nucleotide; codon optimisation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel Pichia cell useful for producing polypeptide of interest, comprises a copy of heterologous nucleotide sequence encoding polypeptide of interest
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 047140

The present invention relates to a mouse model expressing a modified growth hormone and designated SMA1. The model is used to study diseases, test prospective treatments and identify early detection markers associated with abnormal growth hormone (GH) or ICF-1 activity. Particularly dwarfism, Laron syndrome, Illig-type deficiency, Kowarsky syndrome, pituitary gland defliciency, reduced bone mineral density, increased or insufficient body fat accumulation, diabetes, osteoporosis, glomerulosclerosis, gigantism, acromegaly, information processing and connection defects, age-related memory and behaviour deflicits, glucose metabolism disorders and cardiovascular disorders. The present sequence is a PCR primer described in the exemplification of the
                                                                                                                                                                                                                                            Mouse; human; animal model; growth deficiency; cognitive function; growth hormone; IGF-1, osteoporosis; cardiovascular disorder; dwarfism; Illig-type deficiency; Kowarsky syndrome; diabetes; acromegaly; gigantism; glomerulosclerosis; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New animal model expressing a modified growth hormone has reduced body weight and size and is useful to determine treatment for growth hormone, particularly IGF-1 related conditions and diseases

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(d1)thioate with a target sequence and contain at least one phosphoro(d1)thioate link, having endomuclease activity. (A), and more generally any catalytic nucleic acid (A) that modulates expression of the coestrogen receptor gene, are used to treat cancer (particularly of breast or receptor gene, are used to treat cancer (particularly of breast or conformal or for other conditions associated with levels of coestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24748 to AAA2592 represent their corresponding target sequences, and AAA26105 represent ceptor corresponding target sequences, and AAA26107 to AAA26211 represent their corresponding target sequences, and AAA2619 to AAA26211 represent chair corresponding target sequences. AAA26219 to AAA26211 represent content in the procession of the proce
                                                                                                                                                                                      hammerhead ribozyme; hairpin ribozyme; antisense oligonucleotide; gene expression modification; cancer; phosphorothioate; endonuclease; anticancer; breast cancer; endometrium cancer; ss.

Human; Bcl-2; gene therapy; apoptosis inhibitor; mutant; primer; ss.

Human Bcl-2 mutagenic primer oligo-4 for S70D substitution.

10-SEP-2001 (first entry)

```
The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate clink, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or condenderium), in vivo or by transforming cells at vivo and implanting cells or for other conditions associated with levels of catagets. Bob of the control of correlate inhibition of gene expression with cargets, and as research reagents (for RNA, in the same way that modifications in phenotype, particularly for identification of therapeutic restriction endonucleases are used with DNA). The combination of and/or activity. AAA23503 to AAA2447 represent oestrogen receptor corresponding target sequences, and AAA25992 represent their corresponding target sequences. AAA2593 to AAA26107 represent cerponding target sequences, and AAA26107 to AAA2618 represent corresponding target sequences, and AAA26107 to AAA2618 represent corresponding target sequences. AAA2619 to AAA2611 represent cotheir ribozyme sequences and antisense oligonucleotides used in the
                                                                                                                                                                               Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead ribozyme; hairpin ribozyme; antisense oligonucleotide; gene expression modification; cancer; phosphorothioate; endonuclease; anticancer; breast cancer; endometrium cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Karpeisky A, Bellon L;

amino acid sequence of Bc1-2 protein in which at least one serine residue is substituted by alanine or aspartic acid. The protein has increased apoptosis inhibitory activity compared with the wild type Bc1-2 protein. The mutated Bc1-2 protein is useful in the treatment of disorders caused by apoptosis. The present sequence was used to create a mutant Bc1-2 protein of the invention.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
